

SUBSTITUTE SPECIFICATION

Ladder-type and Blue Light-Emitting Polymer with Excellent Thermal Stability

FIELD OF THE INVENTION

The present invention relates to luminescent polymer, specifically ladder-type
5 and blue light-emitting polymer with excellent thermal stability, which are prepared
by polymerization of blue luminescent monomer or grafting blue luminescent
monomer to backbone polymer.

PRIOR ART

10 Polymer has been generally classified as insulator. Recently, development of
conducting polymers such as polyaniline, polypyrrole and polythiophene has
provided high conductivity as same as metal. These polymers have advantages over
metal in aspects of light weight and processability.

15 The conjugated polymers with the electrical and optical characteristics have
been used for the applications of anti-static materials, sensors, electrodes, transistors,
light-emitting materials, solar cell, smart cards, electronic newspapers, and other
display devices. The luminescence polymer has been extensively developed since the
electroluminescence with poly(1,4-phenylenevinylene) was reported in Cambridge
20 group in 1990 (Burroughes, J. H.; Bradley, D. D. C.; Brown, A. R.; Marks, R. N.;
Mackay, K.; Friend, R. H.; Burn, P. L.; Holmes, A. B. Nature 1990;347:539). The
features of luminescence polymer are, in comparison with the inorganic materials,
light weight, thin, self-luminescent, of low threshold voltage. These polymers also
provide fast switching velocity, easy processability, low production cost, low
25 dielectric constant, and most of all, the advantage of easy fabrication and controllable
electrical and optical properties by the modification of their molecular structures.

SUBSTITUTE SPECIFICATION

These properties allow them as the promising light-emitting materials for information and communication technology of the next generation.

5 The blue luminescent polymer employs aromatic groups such as fluorene or spiro-fluorene as conjugated polymers of the backbone polymers as described in U.S. Patents 5593788, 5597890, 5763636, and 5900327. In U.S. Patent 5998045, luminescent polymers are prepared by copolymerization of fluorene and anthracene. The copolymers by fluorene and aromatic compounds (for example, carbazole) are reported in German Patents 198 46 766, 198 46 767, and 198 46 768. In U.S. Patent 10 6395410, electroluminescence devices are prepared with luminescent and transparent polymers.

Much effort is needed as yet in the durability and brightness of the blue light-emitting polymers when they are applied to the luminescent devices. The main reason 15 is due to poor thermal stability. Heat causes molecular movement and generates fine particles or coagulates. Heat generation increases in proportion to the period of working time of electroluminescence devices. The existing light-emitting polymers have the glass transition temperature at around 100 °C (Macromolecules; 1988; 31(4); 1099-1103) causing such problems.

20

SUMMARY OF THE INVENTION

Therefore, the inventors of the present invention intended to prepare the blue luminescent polymers with high melting point and with excellent thermal stability.

25 As a result, ladder-type blue light-emitting polymers that can completely satisfy the said problems were conceived. The present invention comprises

SUBSTITUTE SPECIFICATION

polymerization of blue luminescent monomer or grafting blue luminescent monomer to backbone polymer.

15

DETAILED DESCRIPTION OF THE INVENTION

 The present invention provides the preparation of the thermally stable and blue light-emitting polymers. Novel luminescent polymers with the ladder-type structure are proposed in order to make thermally stable polymer, which has a high
20 glass transition temperature, above 400 °C, and high temperature of 5%-weight loss, above 450 °C, and is easily soluble in solvent for thin film applications. Herein, polystyrene as backbone is transparent in the visible region, increases compatibility with other polymers, inhibits molecular movement and increases thermal stability.

25 The conventional polyfluorene and polyaryl polymers have the structure of (a) as shown in Figure 1, and are movable at a higher temperature above 100 °C. The

SUBSTITUTE SPECIFICATION

ladder-type polymers of the invention have a structural composition as shown in Figure 1 (b), where block A is light-emitting part and block B is polystyrene. Polystyrene has excellent optical properties, high thermal stability and inhibits molecular movement. The polystyrene block is readily dissolved in solvent, and
5 allows easy fabrication.

10 Figure 1: The conceptual picture of a conventional blue light-emitting polymer(a) and a ladder-type blue light-emitting polymer(b)

Therefore, the present invention provides the blue light-emitting polymer represented in Figure 1(b).

15 Wherein, A is selected from polyfluorene, polythiophene, polypyrrole, polycarbazole, polyphenylene, polyaniline, polypyridine; B is selected from polystyrene, polypyrrol, polythiophene, polycarbonate, polyphenylene, polyaniline, polypyridine, polycarbazole; n is an integer of 5 to 100; and m is an integer of 2 to
100.

20

The blue light-emitting polymer can be represented by the following formula

1.

SUBSTITUTE SPECIFICATION

Wherein **A** is polyfluorene; **B** is polystyrene; n is an integer of 5 to 100; and

5 m is an integer of 2 to 100.

[Formula 1]

And, the present invention provides the blue light-emitting polymers containing **Ar** compounds additionally represented in the formula 2

[Formula 2]

SUBSTITUTE SPECIFICATION

Wherein **Ar** is aromatic compounds such as fluorene, fluorene derivatives, benzene, benzene derivatives, thiophene, thiophene derivatives, carbazole, carbazole derivatives, pyridine or pyridine derivatives. Preferable, **B** is polystyrene with atactic or syndiotactic structure in the formula 1 or 2.

5

The ladder-type blue light emitting polymers described above can be synthesized in various methods.

The first method comprises eliminating a hydrogen atom from C₉ position of fluorene or dibromofluorene using n-butyl lithium in tetrahydrofuran, grafting
10 polyvinyl benzene chloride to it, and polymerizing aryl groups with nickel or iron catalyst.

The second method comprises substituting chloride atom of vinyl benzene chloride with fluorene, polymerizing styrene part, and polymerizing fluorene with nickel or iron catalyst. Other method includes polymerizing vinylfluorene, [formula
15 3], or copolymerizing styrene with vinylfluorene to make a polymer of [formula 4], and polymerizing fluorene groups.

[Formula 3]

[Formula 4]

SUBSTITUTE SPECIFICATION

Figure 2: synthetic scheme of the ladder-type blue light-emitting polymer.

15 The polymers exhibited glass transitions (T_g), 422 °C for **P1**, 404 °C for **P2**, and 414 °C for **P3**, and no melting endotherms were found out. Syndiotacticity contributes the high glass temperature of **P3** in spite of low molecular weight. Thermal decomposition temperatures at 5%-weight loss (T_d), 475 °C for **P1**, 448 °C for **P2**, and 233 °C for **P3** were observed. The fluorescence peaks of **P1**, **P2**, **P3** were

20 observed at 401 nm, 416 nm and 415 nm, respectively. For the emission spectrum of **P3**, no shoulder or peak regarding of aggregation of polyfluorene was observed.

SUBSTITUTE SPECIFICATION

Syndiotacticity, due to alternative configuration of fluorene, prevents a large Stoke's shift of the luminescence spectrum.

25

SUBSTITUTE SPECIFICATION

The polymers synthesized, as described above, have high thermal stability and a long life time maintaining the efficiency of light emission. In fabricating
5 devices, the polymers can be coated on an electrode by spin-coating or ink-jetting. They can also increase the compatibility with the polymers of good optical properties (for example, polycarbonate, polymethylmethacrylate and polystyrene). The polymers can be copolymerized with aromatic compounds such as fluorene, benzene, thiophene, carbazole, pyridine, styrene and their respective derivatives.

10

The analytical instruments used are as following. Molecular weight was determined by GPC analysis (Viscotek Co.) using polystyrene standards and THF as solvent at 40 °C. JASCO V-570 and Varian Unit Inova 200 (200 MHz) were used to measure UV-visible and ¹H-NMR spectra, respectively. The thermal data of the
15 ladder-polymers were obtained on nitrogen atmosphere at a rate of 20 °C/min by using Perkin-Elmer's TGC 7/7. Fluorescence spectra were obtained with SLM-AMINCO 4800 spectrofluorometer, in which Rhodamin was used as quantum counter.

The following examples further illustrate the present invention in detail but
20 do not limit the scope thereof.

Example 1: 9-Vinylbenzyl fluorene.

Fluorenyl lithium was prepared by reacting fluorene (10.0 mmol) with *t*-butyl lithium (1.7 M in *n*-pentane, 10.0 mmol) in THF (10 mL) at -78 °C for 2 hours.
25 Fluorenyl lithium was slowly added to vinyl benzene chloride (10 mmol) in THF solution at -78 °C and reacted with stirring for 16 hours. Water (100 mL) and ether

SUBSTITUTE SPECIFICATION

(100 mL) were added and stirred. Organic layer was extracted, dried and recrystallized to obtain needle shape and ivory solid.

¹H-NMR (200 MHz, CDCl₃): 7.77 (2H, d, Fu-H), 7.39-7.20 (10H, m, Fu-H, Bn-H), 6.80-6.66 (1H, q, Vy-H), 5.80-5.70 (1H, d, Vy-H), 5.27-5.21 (1H, d, Vy-H),
5 4.23 (1H, t, Fu-H), 3.10 (1H, d, Bz).

Example 2: Polyvinylbenzyl dibromofluorene

Under N₂ atmosphere, polyvinylbenzyl chloride (1.57 g, M_w 55,000) is
10 dissolved in THF (20 mL). Dibromofluorene (3.24 g) was dissolved in THF (50 mL) and cooled to -78 °C. To this solution, 4 mL of n-butyl lithium (2.5 M, *n*-hexane solution) was added and the resulting solution was added slowly to the above polyvinyl benzene chloride solution. The mixture was stirred at room temperature for 6 hours and water was added. The product was extracted with ethyl ether (200 mL)
15 and dried under vacuum. Obtained product was yellow solid. M_w: 272900. MWD: 5.71. UV-Vis (λ_{max}, THF): 298 nm.

Example 3: Polyvinylbenzyl fluorene

Under N₂ atmosphere, Polyvinylbenzyl chloride (1.57 g, M_w 55,000) was
20 dissolved in THF (20 mL). Fluorene (1.67g) was dissolved in THF (50 mL) and cooled to -78 °C. To this solution added was 4 mL of n-butyl lithium (2.5 M, *n*-hexane solution). The resultant solution was added to the above polyvinyl benzyl chloride solution. The mixture was stirred for 6 hours at room temperature and water was added. The product was extracted with ethyl ether (200 mL) and dried under
25 vacuum. Yellow solid was obtained.

M_w: 68160. MWD: 2.96. UV-Vis ((λ max, THF): 302 nm.

SUBSTITUTE SPECIFICATION

Example 4: Polyvinylbenzyl-polyfluorene (P1)

Under N₂ atmosphere, polyvinylbenzyl fluorene (1.57 g, M_w 55,000) and
5 dihexylfluorene (3g) were dissolved in chloroform (20 mL). To the solution FeCl₃
(5g) was added and stirred for 4 hours at room temperature. To the mixture methanol
was added and the produced precipitates were filtered. The obtained solids were
dissolved in THF and the insoluble solids were discarded. The THF solution was
dried under vacuum ,and yellow solid was obtained.

10 M_w: 79040. MWD: 2.94. UV-Vis ((λ_{max}, THF): 362 nm. PL (λ_{max}, THF):
542 nm. TGA (5%, °C): 475, Glass transition temperature(°C): 421.8.

Example 5: Polyvinylbenzyl-polyfluorene (P2)

Under N₂ atmosphere, polyvinyl benzyl dibromofluorene (1.57g, M_w 55,000)
15 and dihexylfluorene(3g) were dissolved in chloroform(20 mL). To the solution FeCl₃
(5g) was added and stirred for 4 hours at room temperature. To the mixture methanol
was added and the produced precipitates were filtered. The obtained solids were
dissolved in THF and the insoluble solid was discarded. The THF solution was dried
under vacuum, and yellow solid was obtained.

20 M_w: 132200. MWD: 2.07. UV-Vis ((λ_{max}, THF): 362 nm. PL (λ_{max}, THF):
514 nm. TGA (5%, °C): 448, Glass transition temperature (°C): 404.4.

Example 6: Polyvinylbenzyl-polyfluorene (P3)

Under N₂ atmosphere, polyvinyl benzyl dibromofluorene (1.57 g, M_w 55000)
25 and dihexylfluorene (3 g) were dissolved in benzene (20 mL). To the solution
Pd(PPh₃)₄ (5 g) was added and refluxed for 6 hours. To the mixture, methanol was

SUBSTITUTE SPECIFICATION

added and the resultant precipitates were filtered. The obtained solid was dissolved in THF, and the insoluble solid was discarded. The THF solution was dried under vacuum, and yellow solids were obtained.

M_w : 159300. MWD: 4.34. UV-Vis (λ_{max} , THF): 330 nm. PL (λ_{max} , THF):

5 445 nm.

Example 7: Polyvinylbenzene-poly(fluorene-co-thiophene) (P4)

Under N_2 atmosphere, polyvinyl benzyl dibromofluorene (500 mg, M_w 55000) and 3-octylthiophene (2 g) were dissolved in chloroform (20 mL). To the solution $FeCl_3$ (2.5 g) was added and stirred for 4 hours at room temperature. To the mixture, methanol was added and the produced precipitate was filtered. The obtained solid was dissolved in THF, and the insoluble solid was discarded. The THF solution was dried under vacuum, and yellow solid was obtained.

15 M_w : 8911. MWD: 3.14. UV-Vis (λ_{max} , THF): 405 nm. PL (λ_{max} , THF): 544, 682 nm. TGA (5%, $^{\circ}C$): 280. Glass transition temperature ($^{\circ}C$): 384.8

Example 8: Syndiotactic polyvinylbenzyl fluorene

Under N_2 atmosphere, 1-vinyl-4-(1-fluorenyl)methylbenzene (0.52g) was added into a flask and dissolved in toluene (20 mL). To the solution, 12.1 mmol of MAO (2.43 mg, 5 mL) was added slowly and stirred for 30 minutes. 10 mmol of $CpTiCl_3$ (2.19 mg) was dissolved in 1 mL of toluene and added slowly to the solution at room temperature. After addition, the mixture was stirred for one hour at room temperature and poured into a 200 mL of acidic methanol to obtain solid product. The product was washed with methanol, and dried under vacuum for several hours and 0.3 g of copolymer was obtained. M_w : 2500.

SUBSTITUTE SPECIFICATION

Example 9: Syndiotactic polyvinyl benzyl fluorene-co-styrene (P5)

Under N₂ atmosphere, styrene (2.1 g) and 1-vinyl-4-(1-fluorenyl)methylbenzene (0.52 g) were added into the flask and dissolved in toluene (20 mL). To the solution, 12.1 mmol of MAO (2.43 mg, 5mL) was added slowly and stirred for 30 minutes. 10 mmol of CpTiCl₃ (2.19 mg) was dissolved in 1mL of toluene and added slowly to the above solution at room temperature. After addition, the mixture was stirred for 2 hours at room temperature and poured into a 200 mL of acidic methanol to obtain solid product. The product was washed with methanol and dried under vacuum for several hours. 2.5 g of P5 was obtained. M_w: 8,000.

Example 10: Syndiotactic polystyrene-polyfluorene (P6)

Under N₂ atmosphere, P5 (500 mg. M_w 8000) was dissolved in chloroform (20 mL). To the solution, FeCl₃ (2.5 g) was added and stirred for 4 hours at room temperature. Methanol was added to the mixture and the precipitates were filtered. The solid precipitate was dissolved in THF and the insoluble solid was discarded. The THF solution was dried under vacuum, and yellow powder was obtained.

M_w: 4802. MWD: 2.42. UV-Vis (λ_{max} , THF): 353 nm, PL (λ_{max} , THF): 460 nm, TGA (5%, °C): 232.8, Glass transition temperature (°C): 413.5.

EFFECT OF THE INVENTION

A series of 2-dimensional ladder-type polyfluorenes was prepared by introducing atatic or syndiotactic polystyrene as the backbone. The ladder-type polyfluorenes have a high T_g more than 400 °C and excellent thermal stability. No remarkable aggregation of interchains was observed in the ladderized polyfluorene having syndiotactic polystyrene as the backbone. Accordingly, the polymers can be

SUBSTITUTE SPECIFICATION

utilized as blue light-emitting applications such as display devices, household electric appliances and cellular phones.
